LEARNINGS AND REFLECTION:

It was a wonderful yet exhausting journey working on this project, because the simplicity of combining all components and structures, along with the complexity of debugging multiple errors and issues, was tiring.

From brainstorming ideas, when we came to this project, we first decided to finish the basics. And that was one of the best motives because it helped us finish each part of the final project step-by-step. Some ideas had to be abandoned due to unfeasibility or complexity arising, as mentioned in the Testing PDF about the IR sensor and the buzzer.

We also learned the importance of working in a clean environment, free from clutter, because of the number of mistakes we made with jumbled wires, crowded GPIO pins, and weakly screwed Motor Driver ports.

Altogether, it tested our patience and diligence, along with a keen eye to make sure everything worked well. And moreover, worked the way it was meant to (The DC motor still works on its own).
